Study Plan Template and Question Bank Statistics

Document ID: CF101-PLAN | Applies to the CF-101 exam

This document explains how to split weekly study hours across domains, gives a weekly plan template, and provides question bank and candidate benchmark statistics.

Hour allocation formula

- Mastery target per domain: 80 percent.
- Gap of a domain = max(0, 80 minus the student's latest mock score in that domain).
- Priority of a domain = domain weight (%) x gap.
- Hours for a domain = total weekly hours x priority of the domain / sum of priorities of all domains.
- If every gap is 0, split the hours in proportion to the domain weights.

Table 4.1 - Worked example (illustrative scores, 10 weekly hours)

Domain	Weight	Latest score	Gap	Priority	Hours
Cloud Concepts	15	75	5	75	0.5
Compute & Networking	25	70	10	250	1.7
Storage & Data	20	60	20	400	2.7
Security & Identity	25	50	30	750	5.1
Monitoring & Cost	15	80	0	0	0.0
Sum				1475	10.0

Table 4.2 - Weekly plan template (split of study time)

Activity	Share of weekly hours (%)	Hours at 10 h/week
Learning new material	60	6.0
Practice questions	25	2.5
Review of past mistakes	15	1.5

Table 4.3 - Question bank statistics

Domain	Questions	Easy	Medium	Hard	Candidate pass rate (%)
Cloud Concepts	180	90	70	20	84
Compute & Networking	320	100	150	70	71
Storage & Data	260	95	115	50	76
Security & Identity	310	70	140	100	63
Monitoring & Cost	190	80	85	25	79
TOTAL	1260	435	560	265	73 (overall)

Candidate pass rate = share of candidates who answer questions of that domain correctly in the public bank.

Table 4.4 - Scaled score percentiles of real CF-101 candidates

Percentile	Scaled score
10th	590
25th	640
50th (median)	700
75th	760
90th	820

Table 4.5 - Typical score gain versus weekly study hours (all candidates)

Weekly hours	Average weekly gain (scaled points)
4	6
6	10
8	14
10	17
12	19
15	20

Gains flatten above about 12 weekly hours: more hours still help, but each additional hour adds less.
